Agile Team Charter

- **Team Purpose & Vision**

- Why do we exist as a team?

  We help the organization ensure optimal database performance, high availability, and proactive risk detection across all enterprise data platforms. Database consumers, system administrators, and application teams need zero downtime, fast query response times, and automated visibility into server health. We deliver this through an internal **Informix Telemetry Dashboard**, an active **Database Performance Benchmarking Lab**, and database-level **Fraud Detection Trigger Mechanisms**.

  Success Definition: Success looks like:

  - A live **Informix Telemetry Dashboard** providing real-time visibility into CPU wait states, memory allocation, buffer pool hit ratios, and active session locks without placing locking overhead on the server.
  - A functional **DB Performance Lab** comparing query execution plans and index optimizations across PostgreSQL, MariaDB, MySQL Workbench, and MongoDB to identify bottlenecks before production releases.
  - Reliable **Fraud Detection Triggers** executing in under 5 ms at the database layer to automatically audit and flag anomalous transactional behavior.
  - All database scripts, automation routines, and query tuning verified through peer review and logged consistently in daily stand-ups and sprint backlogs.

  Product / Service: We are responsible for:

  1. **Informix Telemetry Dashboard:** Real-time host performance monitoring (CPU wait states, memory buffer allocation, disk I/O, and session contention).
  2. **DB Performance Lab:** Multi-engine query profiling (EXPLAIN ANALYZE), indexing benchmarks (B-Tree vs. Hash vs. Compound), and comparative load testing across PostgreSQL, MariaDB, MySQL, and MongoDB.
  3. **Transactional Fraud Detection Engine:** Database-level trigger logic, risk-scoring procedures, and normalized fraud audit trail tables.
  4. **DBA Tooling & Automation:** Linux shell scripts executed via MobaXterm for automated health checks, connection diagnostics, and backup verification.

- **Team Members & Roles**

Name	Role	Key Responsibilities
Hillary Itlhabanyeng	DBA Intern	Create the dashboard, writing the scripts and queries. I am

		doing the backups and restores too
Timothy May	Mentor	He helps with assigning and prioritizes work; approves deliverables; gives feedback; signs monthly reports
Kyle Leon	DBA administrators	He also helped with the feedback and gave me points on where to fix it, doing the basics of administrating
Le'cole Scheepers	Project Manager	Helps with creating meetings for our standups and helping us to schedule our deadlines and projects

- **Ways of Working**

How we work together day to day:

Agile Framework

- **Kanban / Scrum-ban:** Trello board tracking sprint iterations, daily task progression, and backlog priorities.

Ceremonies

- **Daily Stand-Up Meetings:** 15-minute sync (09:15 daily via Microsoft Teams/Slack) to review completed work, daily technical goals, and active blockers.
- **Weekly Thursday Review:** Weekly review to inspect sprint progress, audit the Agile logbook, and refine upcoming backlog tickets.
- **Sprint Review & Retrospective:** Bi-weekly session to demo telemetry tools, review benchmark metrics, and agree on process improvements.

- **Working Agreements**

Rules we agree to follow as a team

1. We test all SQL queries and shell scripts in sandbox/lab environments before touching staging or production servers.
2. We show up prepared and on time for all daily stand-ups and reviews.
3. We respect timeboxes during meetings (15 minutes maximum for stand-ups).
4. We raise blockers early—especially server access, port permissions, or connection timeouts in MobaXterm.
5. We give and receive constructive feedback during query plan reviews and pull requests.
6. We maintain transparency in all tasks, updating Trello checklist cards in real time.

- **Communication**

How and when we communicate

- **Primary Channels:**
- Slack / Microsoft Teams: Real-time questions, stand-up syncs, and immediate technical blockers.
- Trello: Task tracking, sprint planning, and checklist progress.
- GitHub: Script version control, pull requests, and peer reviews.
- MobaXterm / SSH Terminal: Secure remote execution and Linux host monitoring.

Response-Time Expectations:

- Urgent environment/server alerts: Immediate response in the team escalation channel.
- Routine queries and PR reviews: Within 2 to 4 business hours.

Remote / Hybrid Norms:

- Active participation during stand-ups and sprint retrospectives.
- Transparent availability on team chat during core focus hours (09:00 – 16:00).
- Regular Git commits and consistent logging of daily work.

- **Decision-Making**

How decision are made:

Collaborative Technical Review: Routine schema designs and script enhancements are decided through peer review and consensus.

Lead DBA Final Decision: Core database schema modifications, production migrations, and server-level configuration changes require final approval from the Senior DBA / Tech Lead.

Stakeholder Sign-Off: Fraud detection thresholds and compliance rules require sign-off from the Risk Analyst.

Escalation Path if We're Stuck:

1. Attempt local diagnostic logging and query profiling in sandbox.
2. Raise the blocker immediately during stand-up or in the Slack DBA channel.
3. Escalate to the Senior DBA for architectural guidance or environment permission elevation.

7.Definition Of Done(DoD)

When is work really “done”?

- ✓ SQL queries / shell scripts written and verified in sandbox environment
- ✓ Query execution verified with EXPLAIN ANALYZE or Informix profiling tools (no unindexed full-table scans or locking overhead).
- ✓ Error handling, connection timeouts, and rollback logic included.
- ✓ Script reviewed and approved by the Senior DBA / Tech Lead.
- ✓ Technical documentation and README runbooks updated.
- ✓ Trello task card checklists completed and moved to Done.
- ✓ Daily achievements and blockers recorded in the Agile Logbook.

8.Core Values & Behaviors

- **Data Integrity First:** Protecting data consistency and uptime takes precedence over fast shortcuts.
- **Transparency:** Honest reporting of query latency, failed scripts, and system bottlenecks.
- **Accountability:** Taking full ownership of assigned sprint deliverables from local testing to staging.
- **Trust & Psychological Safety:** Asking questions and raising mistakes without fear of blame.
- **Learning Mindset:** Actively absorbing multi-engine database concepts, Linux internals, and tuning principles.
- **Collaboration:** Assisting colleagues across disciplines to ensure smooth end-to-end integration.

9.Risks and Constraints

What could impact our success?

Known Risks:

- Remote connectivity or VPN drops interrupting long-running MobaXterm sessions.
- Staging database permission restrictions slowing down schema deployments.
- Heavy diagnostic queries placing unintended resource load on database catalog tables.

Dependencies:

- Provisioning of staging database access credentials and network firewall ports by the Infrastructure team.
- Prompt code and schema reviews from the Senior DBA.

Constraints (Time, Tools, Skills):

- Time: Strict academic submission windows alongside day-to-day internship deliverables.
- Tools: Reliance on terminal-based utilities and open-source tooling across multiple distinct database engines.
- Skills: Learning the internal system catalog structures of legacy engines like Informix while managing modern document engines like MongoDB.

10.Review & Improvement

Keeping the charter alive

- Charter reviewed every:
  ☐ Quarter ☐ Retrospective ☐ Release

Last updated: 21 October 2026

11.Team Commitment

Our agreement to this charter

By working on this team, we commit to the principles and agreements outlined above:
